## What's Hot About Water Heaters?

When we think about where our energy dollars go, we notice the obvious choices we see every day around the house - lights, kitchen appliances, television, and air conditioning and heating. But we tend to overlook the expense of heating water for our daily needs; however 25% of each energy dollar goes to heat water.

Like most appliances, water heaters have improved greatly in recent years. Today's models are much more energy efficient. You are able to purchase a more efficient water heater that will save you money on energy each month. That's why you shouldn't just consider the initial purchase price - think about how much it costs to operate.

The average life expectancy of a water heater is 13 years. That's how long you'll be living with the decision you make now. If you choose a water heater that saves you money, the savings will continue for years.

If your new water heater saves an average of a dollar a month in energy costs, that amounts to a savings of \$12 a year - or \$156 over its expected lifespan.

Pick up one of these efficient water heaters today from First Supply.

GPHE-50 Vertex  
Power Vent

GDHE-50 Vertex 100  
Power Direct Vent

The Vertex Power Vent is rated at 90% Thermal Efficiency. The Vetex 100 is rated at 96% Thermal Efficiency.
