### Puraflo Wastewater Treatment System

**A highly effective biofiltration system that uses biofibrious peat to treat domestic strength wastewater.**

The Puraflo Wastewater Treatment System is a natural Wastewater Treatment System for Onsite Wastewater Treatment. Utilizing a unique biofibrious peat filter media, the Puraflo Wastewater Treatment System is one of the highest performing, most reliable Wastewater Treatment Systems on the market today. It has proven itself for over 15 years in a large number of U.S. residential and light commercial applications, as well as sites subject to intermittent use or existing sites needing repairs or upgrades.

The greatest benefits are derived from the reliability and simplicity of how the Puraflo Wastewater Treatment System works, with no blowers or re-circulating pumps required, an important feature for any residential Wastewater Treatment System.

Following a septic tank containing an effluent filter the Wastewater is time dosed, into the Puraflo Wastewater Treatment System. Time dosing is an important aspect of the design that protects the drain field and ensures high Wastewater Treatment performance, with ammonia levels of <5mg/l. For sites where no power is available a siphon system can be utilized for time-dosing.

Other benefits include the ability to disperse the treated effluent directly through a gravel pad underneath the Puraflo Wastewater Treatment System. Not to mention, the very low operating cost, the factory assembly reducing installation costs and the modular design of the Puraflo Wastewater Treatment System allowing phasing of the construction.

Puraflo is manufactured by Bord Na Móna Environmental Products U.S. Inc. and available from First Supply. Call your sales person for more information.
